Why Worry About the Unvaccinated? By Christine Vara

Time and again, we hear this from parents who choose not to vaccinate their children.

"If your child is vaccinated, why are you worried about them catching anything from my child?"

This is a common response from parents when it is suggested that a purposely unvaccinated child poses a threat to others.

One thing that many parents may not understand is that while vaccinations are highly effective, and greatly decrease the chance of contracting preventable diseases, no vaccine is 100% effective. According to [CDC reports](#), “most routine childhood vaccines are effective for 85% to 95% of recipients. For reasons related to the individual, some will not develop immunity.”

Needle Tips: Online publication for health professionals from the Immunization Action Coalition

This issue features important information about the 2016–17 influenza recommendations, including related "Ask the Experts" Q&As from CDC medical officer Andrew T. Kroger, MD, MPH, and nurse educator Donna L. Weaver, RN, MN, both with the National Center for Immunization and Respiratory Diseases, CDC. In addition, it includes many immunization resources that healthcare professionals can use in their practice settings, including IAC's standing orders templates for administering influenza vaccine to children, adolescents, and adults, and pneumococcal vaccines (PSC13 and PPSV23) to adults.
